

**The week in
seven charts**

How does the S&P 500 perform when the Fed starts hiking?

Meanwhile, bond yields are rising across major markets. Each week, the Syz investment team takes you through the last seven days in seven charts.

Chart #1

S&P 500 returns around the start of Fed hiking cycles

Drawing on the last seven tightening cycles, Goldman Sachs observes that the S&P 500 typically has a difficult start, losing an average of 2% over the first three months.

This slump rarely lasts long. The index then rises by an average of 9% over the following twelve months. 2022 was the painful exception. Earnings growth ultimately sets the market's direction, but the speed and volatility of the move in rates can weigh heavily on equities along the way.

Chart #2

Global bond yields at multi-decade highs

Every major government bond market is under pressure at the same time. Japan's 10-year yield has just reached 3% for the first time this century, while US yields stand at their highest since 2007, UK yields since 2008, and German yields since 2011.

Chart #3

The historic relationship between gold and US real yields has broken down

This is one of the most striking macroeconomic divergences in today's markets. Gold's long-standing link to US real yields has come apart. Since Western governments froze Russia's reserves, central banks have increasingly treated gold as politically neutral reserve collateral. Real yields, meanwhile, are moving towards levels the US fiscal position can barely absorb. At this level of debt, real rates that stay higher for longer are more than merely restrictive, they represent a growing solvency risk.

This divergence is reflected in current market levels, with gold trading near \$4,400 while 10-year real yields stand at around 2.5%.

Chart #4

Gold rate hikes have some good historical news for investors

Historically, gold has tended to strengthen after the Fed's first rate hike, with the strongest gains occurring in the following six months.

Gold Has Historically Strengthened After the Fed's First Rate Hike

Average gold return around the first rate hike of a tightening cycle

Source: Sentimentrader analyst summary supplied by user. Historical first-hike cycles, 1994-2026. Pre-hike sample n=6; post-hike sample n=5 because 2026 forward returns are not yet observable. "Win rate" is historical frequency, not a forecast probability.

Chart #5

Tanker earnings exceed \$1 million a day on benchmark

For the first time, the cost of chartering an oil tanker on the industry's benchmark route from the Middle East to the Far East has passed \$1 million a day. A year ago, the same voyage earned less than \$100,000 a day.

Chart #6

S&P 500 price vs. valuation

What explains the resilience of the S&P 500?
Exceptionally strong earnings growth.

Geopolitical shocks and persistent uncertainty, which have pushed oil prices and bond yields higher, have nonetheless triggered a valuation reset of the kind normally seen in a bear market. The index's P/E multiple has compressed from 23x at the end of 2024 to roughly 19x today. The headline index looks resilient, yet beneath the surface uncertainty is already being priced in through lower valuations.

Chart #7

62% of the entire S&P 500 index's expected EPS growth comes from one industry

The five largest companies now represent a record 27% of expected S&P 500 earnings over the next 12 months. More striking still, semiconductors and semiconductor equipment are forecast to deliver 9.6 percentage points of the 15.4% consensus EPS growth expected for the S&P 500 in 2027. In other words, a single industry accounts for 62% of the index's entire expected EPS growth.

None of this implies that the semiconductor forecasts are wrong. It does mean the margin for error is narrowing: the companies carrying earnings growth have to keep delivering, while elevated inflation prevents the discount rate from offering any relief.

BofA also expects Hyperscalers capex growth to decelerate from more than 90% in 2026 to around 35% in 2027. That is still a very high rate, but the acceleration phase is fading just as the index becomes unusually dependent on semiconductor earnings.
